# **Detour:** Inverse of partioned symmetric matrix <sup>1</sup>

Consider an  $n \times n$  symmetric matrix A and divide it into four blocks

$$A = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix} = \begin{bmatrix} A_{11} & A_{12} \\ A_{12}^T & A_{22} \end{bmatrix}$$

For example, let n = 3, we have

$$A = \begin{bmatrix} 1 & 2 & 3 \\ 2 & 5 & 6 \\ 3 & 6 & 8 \end{bmatrix}$$

We could for example have

$$\underline{A_{11} = \begin{bmatrix} 1 & 2 \\ 2 & 5 \end{bmatrix}} \text{ and } A_{12} = \begin{bmatrix} 3 \\ 6 \end{bmatrix} \text{ and } A_{22} = \begin{bmatrix} 8 \end{bmatrix}$$

<sup>&</sup>lt;sup>1</sup>Courtesy: http:

# Detour: Inverse of partioned symmetric matrix

Question: Write 
$$B=A^{-1}$$
 in terms of the four blocks 
$$B=\begin{bmatrix} B_{11} & B_{12} \\ B_{12}^T & A_{22} \end{bmatrix}=A^{-1}$$
 
$$A_{11} \text{ and } B_{11}\in R^{p\times p}$$
 
$$A_{22} \text{ and } B_{22}\in R^{q\times q}$$
 
$$A_{12}=A_{21}^T \text{ and } B_{12}=B_{21}^T\in R^{p\times q}$$
 and,  $p+q=n$ 

# Detour: Inverse of partioned symmetric matrix

$$I_{n} = AA^{-1} = AB$$

$$= \begin{bmatrix} A_{11} & A_{12} \\ A_{12}^{T} & A_{22} \end{bmatrix} \begin{bmatrix} B_{11} & B_{12} \\ B_{12}^{T} & B_{22} \end{bmatrix} =$$

$$\begin{bmatrix} A_{11}B_{11} + A_{12}B_{12}^{T} & A_{11}B_{12} + A_{12}A_{22} \\ A_{12}^{T}B_{11} + A_{22}B_{12}^{T} & A_{12}^{T}B_{12} + A_{22}B_{22} \end{bmatrix} = \begin{bmatrix} I_{p} & 0 \\ 0 & I_{q} \end{bmatrix}$$

Thus, we have

$$A_{11}B_{11} + A_{12}B_{12}^{T} = I_{p}$$

$$A_{11}B_{12} + A_{12}A_{22} = 0^{p \times q}$$

$$A_{12}^{T}B_{11} + A_{22}B_{12}^{T} = 0^{q \times p}$$

$$A_{12}^{T}B_{12} + A_{22}B_{22} = I_{q}$$

#### **Detour: Inverse of partioned symmetric matrix**

Moving the expressions around we get the following results.

$$B_{11} = (A_{11} - A_{12}A_{22}^{-1}A_{12}^{T})^{-1} = A_{11}^{-1} + A_{11}^{-1}A_{12}(A_{22} - A_{12}^{T}A_{11}^{-1}A_{12})^{-1}A_{12}^{T}A_{12}^{T}$$

$$B_{22} = (A_{22} - A_{12}^{T}A_{11}^{-1}A_{12})^{-1} = A_{22}^{-1} + A_{22}^{-1}A_{12}^{T}(A_{11} - A_{12}A_{22}^{-1}A_{12}^{T})^{-1}A_{12}A_{12}^{T}A_{$$

 $B_{12}^{T} = -A_{11}^{-1}A_{12}^{T}(A_{22} - A_{12}^{T}A_{11}^{-1}A_{12})^{-1}$ 

#### **Determinant of Partitioned Symmetric Matrix**

**Theorem:** Determinant of a partitioned symmetric matrix can be written as follows

$$|A| = \left| \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix} \right|$$

$$= |A_{11}||A_{22} - A_{12}^T A_{11}^{-1} A_{12}|$$

$$= |A_{22}||A_{11} - A_{12} A_{22}^{-1} A_{12}^T|$$

#### **Determinant of Partitioned Symmetric Matrix**

**Proof:** Note that

$$A = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix} = \begin{bmatrix} A_{11} & 0 \\ A_{12}^{\mathsf{T}} & I \end{bmatrix} \begin{bmatrix} I & A_{11}^{-1} A_{12} \\ 0 & A_{22} - A_{12}^{\mathsf{T}} A_{11}^{-1} A_{12} \end{bmatrix}$$
$$= \begin{bmatrix} I & A_{12} \\ 0 & A_{22} \end{bmatrix} \begin{bmatrix} A_{11} - A_{12} A_{22}^{-1} A_{12}^{\mathsf{T}} & 0 \\ A_{22}^{-1} A_{21} & I \end{bmatrix}$$

The theorem is proved as we also know that

$$|AB| = |A||B|$$

and

$$\begin{vmatrix} B & 0 \\ C & D \end{vmatrix} = \begin{vmatrix} B & C \\ 0 & D \end{vmatrix} = |B| |D|$$

#### Marginalisation and Conditional of multivariate normal<sup>2</sup>

Assume an n-dimensional random vector

$$\mathbf{x} = \begin{bmatrix} \mathbf{x}_1 & \mathbf{x}_2 \end{bmatrix}$$

has a normal distribution  $N(\mathbf{x}, \mu, \Sigma)$  with

$$\mu = \begin{bmatrix} \mu_1 \\ \mu_2 \end{bmatrix} \text{ and } \Sigma = \begin{bmatrix} \Sigma_{11} & \Sigma_{12} \\ \Sigma_{21} & \Sigma_{22} \end{bmatrix}$$

where  $\mathbf{x}_1$  and  $\mathbf{x}_2$  are two subvectors of respective dimensions p and q with p+q=n. Note that  $\Sigma=\Sigma^T$ , and  $\Sigma_{21}=\Sigma^T_{21}$ .

<sup>&</sup>lt;sup>2</sup>Courtesy: http:

<sup>//</sup>fourier.eng.hmc.edu/e161/lectures/gaussianprocess/node7.html.

#### Theorem:

part a: The marginal distributions of  $\mathbf{x}_1$  and  $\mathbf{x}_2$  are also normal with mean vector  $\mu_i$  and covariance matrix  $\Sigma_{ii}$  (i=1,2), respectively.

**part b:** The conditional distribution of  $\mathbf{x}_i$  given  $\mathbf{x}_j$  is also normal with mean vector

#### **Proof:**

The joint density of x is:

$$f(\mathbf{x}) = f(\mathbf{x}_1, \mathbf{x}_2) = \frac{1}{(2\pi)^{n/2|\Sigma|^{1/2}}} exp[-\frac{1}{2}Q(\mathbf{x}_1, \mathbf{x}_2)]$$

where Q is defined as

$$Q(\mathbf{x}_{1}, \mathbf{x}_{2}) = (\mathbf{x} - \mu)^{T} \Sigma^{-1} (\mathbf{x} - \mu)$$

$$= [(\mathbf{x}_{1} - \mu_{1})^{T}, (\mathbf{x}_{2} - \mu_{2})^{T}] \begin{bmatrix} \Sigma^{11} & \Sigma^{12} \\ \Sigma^{21} & \Sigma^{22} \end{bmatrix} \begin{bmatrix} \mathbf{x}_{1} - \mu_{1} \\ \mathbf{x}_{2} - \mu_{2} \end{bmatrix}$$

$$= (\mathbf{x}_{1} - \mu_{1})^{T} \Sigma^{11} (\mathbf{x}_{1} - \mu_{1}) + 2(\mathbf{x}_{1} - \mu_{1})^{T} \Sigma^{12} (\mathbf{x}_{2} - \mu_{2}) + (\mathbf{x}_{2} - \mu_{2})^{T} \cdots$$

$$\cdots \Sigma^{22}(\mathbf{x}_2 - \mu_2)$$

Here we have assumed

$$\Sigma^{-1} = \left[ \begin{array}{cc} \Sigma_{11} & \Sigma_{12} \\ \Sigma_{21} & \Sigma_{22} \end{array} \right]^{-1} = \left[ \begin{array}{cc} \Sigma^{11} & \Sigma^{12} \\ \Sigma^{21} & \Sigma^{22} \end{array} \right]$$

According to inverse of a partitioned symmetric matrix we have,

$$\Sigma^{11} = \left(\Sigma_{11} - \Sigma_{12}\Sigma_{22}^{-1}\Sigma_{12}^{T}\right)^{-1} = \Sigma_{11}^{-1} + \Sigma_{11}^{-1}\Sigma_{12}\left(\Sigma_{22} - A_{12}^{T}\Sigma_{11}^{T}\Sigma_{12}\right)^{-1}\Sigma_{12}^{T}$$

$$\Sigma^{22} = \left(\Sigma_{22} - \Sigma_{12}^{T}\Sigma_{11}^{-1}\Sigma_{12}\right)^{-1} = \Sigma_{22}^{-1} + \Sigma_{22}^{-1}\Sigma_{12}^{T}\left(\Sigma_{11} - \Sigma_{12}\Sigma_{22}^{-1}\Sigma_{12}^{T}\right)^{-1}\Sigma_{12}^{T}$$

$$\Sigma^{12} = -\Sigma_{11}^{-1}\Sigma_{12}\left(\Sigma_{22} - \Sigma_{12}^{T}\Sigma_{11}^{-1}\Sigma_{12}\right)^{-1} = \left(\Sigma^{21}\right)^{T}$$

Substituting the second expression for  $\Sigma^{11}$ , first expression for  $\Sigma^{22}$ ,

$$Q(\mathbf{x}_{1}, \mathbf{x}_{2}) = (\mathbf{x}_{1} - \mu_{1})^{T} \left[ \Sigma_{11}^{-1} + \Sigma_{11}^{-1} \Sigma_{12} \left( \Sigma_{22} - A_{12}^{T} \Sigma_{11}^{-1} \Sigma_{12} \right)^{-1} \Sigma_{12}^{T} \Sigma_{11}^{-1} \right]$$

$$-2\left(\mathbf{x}_{1}-\mu_{1}\right)^{T}\left[\Sigma_{11}^{-1}\Sigma_{12}\left(\Sigma_{22}-\Sigma_{12}^{T}\Sigma_{11}^{-1}\Sigma_{12}\right)^{-1}\right]\left(\mathbf{x}_{2}-\mu_{2}\right)$$

 $+\left(\mathbf{x}_{2}-\mu_{2}
ight)^{T}\left|\left(\mathbf{\Sigma}_{22}-\mathbf{\Sigma}_{12}^{T}\mathbf{\Sigma}_{11}^{-1}\mathbf{\Sigma}_{12}
ight)^{-1}\right|\left(\mathbf{x}_{2}-\mu_{2}
ight)$ 

 $= (\mathbf{x}_1 - \mu_1)^T \Sigma_{11}^{-1} (\mathbf{x}_1 - \mu_1)$ 

 $+\left(\mathbf{x}_{1}-\mu_{1}\right)^{T}\Sigma_{11}^{-1}\Sigma_{12}\left(\Sigma_{22}-A_{12}^{T}\Sigma_{11}^{-1}\Sigma_{12}\right)^{-1}\Sigma_{12}^{T}\Sigma_{11}^{-1}\left|\left(\mathbf{x}_{1}-a_{12}^{T}\Sigma_{12}^{T}\Sigma_{12}^{T}\right)^{-1}\Sigma_{12}^{T}\Sigma_{12}^{T}\right|$ 

 $-2\left(\mathbf{x}_{1}-\mu_{1}\right)^{T}\left|\Sigma_{11}^{-1}\Sigma_{12}\left(\Sigma_{22}-\Sigma_{12}^{T}\Sigma_{11}^{-1}\Sigma_{12}\right)^{-1}\right|\left(\mathbf{x}_{2}-\mu_{2}\right)^{T}$ 

and  $\Sigma^{12}$  into  $Q(\mathbf{x}_1, \mathbf{x}_2)$  to get:

$$= (\mathbf{x}_{1} - \mu_{1})^{T} \Sigma_{11}^{-1}$$

$$+ \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left( \Sigma_{22} - \Sigma_{12}^{T} \Sigma_{11}^{-1} \Sigma_{12} \right)^{-1} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} \Sigma_{12} \right]^{-1} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} \Sigma_{12} \right]^{-1} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{T} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{T} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{T} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{T} (\mathbf{x}_{1} - \mu_{2}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{T} (\mathbf{x}_{1} - \mu_{2}) \right]^{T} \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{T} (\mathbf{x}_{1} - \mu_{2}) \right]^{T} \left[ (\mathbf{x}_$$

The last equal sign is due to the following equations for any vectors u and v and a symmetric matrix  $A = A^T$ :

$$u^{T}Au - 2u^{T}Av + v^{T}Av = u^{T}Au - u^{T}Av - u^{T}Av + v^{T}Av$$
  
=  $u^{T}A(u - v) - (u - v)^{T}Av = u^{T}A(u - v) - v^{T}A(u - v)$   
=  $(u - v)^{T}A(u - v) = (v - u)^{T}A(v - u)$ 

We define 
$$b \triangleq \mu_2 + \Sigma_{12}^T \Sigma_{11}^{-1} (\mathbf{x}_1 - \mu_1)$$
 
$$A \triangleq \Sigma_{22} - \Sigma_{12}^T \Sigma_{11}^{-1} \Sigma_{12}$$

and

$$\begin{cases} Q_{1}(\mathbf{x}_{1}) & \triangleq (\mathbf{x}_{1} - \mu_{1})^{T} \Sigma_{1}^{-1} (\mathbf{x}_{1} - \mu_{1}) \\ Q_{2}(\mathbf{x}_{1}, \mathbf{x}_{2}) & \triangleq \left[ (\mathbf{x}_{2} - \mu_{2}) - \Sigma_{12}^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1}) \right]^{T} (\Sigma_{22} - \Sigma_{12}^{T} \Sigma_{11}^{-1} \Sigma_{12})^{-1} \\ & = (\mathbf{x}_{2} - b)^{T} A^{-1} (\mathbf{x}_{2} - b) \end{cases}$$

and get

$$Q(\mathbf{x}_1, \mathbf{x}_2) = Q_1(\mathbf{x}_1) + Q_2(\mathbf{x}_1, \mathbf{x}_2)$$

Now the joint distribution can be written as:

$$f(\mathbf{x}) = f(\mathbf{x}_{1}, \mathbf{x}_{2}) = \frac{1}{(2\pi)^{n/2} |\Sigma|^{1/2}} \exp\left[-\frac{1}{2}Q(\mathbf{x}_{1}, \mathbf{x}_{2})\right]$$

$$= \frac{1}{(2\pi)^{n/2} |\Sigma_{11}|^{1/2} |\Sigma_{22} - \Sigma_{12}^{T} \Sigma_{11}^{-1} \Sigma_{12}|^{1/2}} \exp\left[-\frac{1}{2}Q(\mathbf{x}_{1}, \mathbf{x}_{2})\right]$$

$$= \frac{1}{(2\pi)^{p/2} |\Sigma_{11}|^{1/2}} \exp\left[-\frac{1}{2}(\mathbf{x}_{1} - \mu_{1})^{T} \Sigma_{11}^{-1} (\mathbf{x}_{1} - \mu_{1})\right] \frac{1}{(2\pi)^{q/2} |A|^{1/2}}$$

$$= N(\mathbf{x}_{1}, \mu_{1}, \Sigma_{11}) N(\mathbf{x}_{2}, b, A)$$

The third equal sign is due to Determinant of a partitioned symmetric matrix:

$$\left|\Sigma\right| = \left|\Sigma_{11}\right| \left|\Sigma_{22} - \Sigma_{12}^{\mathcal{T}} \Sigma_{11}^{-1} \Sigma_{12}\right|$$

The marginal distribution of  $x_1$  is

$$f_1(\mathbf{x}_1) = \int f(\mathbf{x}_1, \mathbf{x}_2) d\mathbf{x}_2 = \frac{1}{(2\pi)^{p/2} |\Sigma_{11}|^{1/2}} \exp\left[-\frac{1}{2} (\mathbf{x}_1 - \mu_1)^T \Sigma_{11}^{-1} (\mathbf{x}_1 - \mu_2)^T \Sigma_{11}^{-1} (\mathbf{x}_1 - \mu_2)^T \Sigma_{11}^{-1} (\mathbf{x}_2 - \mu_2)^T \Sigma_{12}^{-1} (\mathbf{x}_2 - \mu_2$$

and the conditional distribution of  $\mathbf{x}_2$  given  $\mathbf{x}_1$  is

$$f_{2|1}(\mathbf{x}_2|\mathbf{x}_1) = \frac{f(\mathbf{x}_1, \mathbf{x}_2)}{f(\mathbf{x}_1)} = \frac{1}{(2\pi)^{q/2}|A|^{1/2}} \exp\left[-\frac{1}{2}(\mathbf{x}_2 - b)^T A^{-1}(\mathbf{x}_2 - b)\right]$$

with

$$b = \mu_2 + \Sigma_{12}^T \Sigma_{11}^{-1} (\mathbf{x}_1 - \mu_1)$$
$$A = \Sigma_{22} - \Sigma_{12}^T \Sigma_{11}^{-1} \Sigma_{12}$$
